Week 5 – Feature Files

👤 **mycookiebook**   🕐 **30. Oct 2020**   📁 **Allgemein**   ✏️ **Edit**

Hey Cookies,

we update you perfectly for the start of the weekend.

This week we were working on our feature files and also implementing them in Cucumber. We already designed our feature files to run tests easier in the future. There you describe your test in a normal common language. It contains one or more scenarios in the required syntax.

In our meeting we talked about the Use-Cases we worked on in the last few weeks and created feature files of the following two:

- *Edit Profile*
- *Manage Recipe*

But still, if you think there is something missing, feel free to tell us.

Here you can have a look on our Cucumber ***Testrun***.

Stay tuned and safe

your MyCookieBook-Team

Aloha CookieMonster or what ever …,

we really enjoyed your blog. It is written quite well and your feature files are looking lit af. Hopefully you also can keep your standards high in the future.
Sadly there are a few points to criticize about your blog:
1) "we update you perfectly for the start of the weekend" –> we update you just in time for the start of the weekend

2) In Feature: Edit Profile; In Scenario: Already existing username ~ there should be ether a check if the username "ExsistingUsername" already exists. On the other hand your could set a precondition that the user with the ExsistingUsername already exists (and must be unique). We are aware that the name is implying it but the check is necessary for further implementation.
3) "I am registered user" ~ please insert an "a"
4) Point 2) also implies for the "Invalid Email"
5) We guess in the scenario "Invalid Email" you wanted to use "testEmail" insted of "testTest"
6) Additionally you could have more preconditions in your "Manage recipes" feature file. Even tough this is probably a choice of style.

Thanks for the interesting blog and for the great insight into your project.

Kind regards,

TEAM Vaultionizer

Hey TEAM Vaultionizer,

thank you for your quick feedback.

Thank you also for carefully reading our feature files. Your comments from point two and four will be implemented as soon as possible. Just like the bug in 'testTest'.
We will keep your last point in mind.

Have a nice day!

Good Morning CookieBook-Team,

I like your description of your done steps on your blog. There readers can follow your process of working on that project.

Now I will write about your feature files.

First of all I like your feature files, they are precise and written how feature files should be written. Now following I have some little thoughts what I would do at some point.

editProfile:
– In Scenario Edit Email: I would check if the user has access to the given mail address. I would do that with a verification mail. Otherwise the user could probably type in a wrong mail and will wonder why he does not get his mail notifiactions and probably important information you need to send to your users.

– In Scenario Edit Password: I would give the user a field "password confirmation" or how you want to name it. There the user should write his password a second time to confirm he didn`t misstype by the first one. You should check if both fields have the same input.

manageRecipes:
– In Scenario Create recipe: In edit recipe you give the recipe a "Duration", is that an optional information or should you add that to your "Create recipe" scenario?

I realy like that you choose the difficulty level in cookies, that is a funny idea. I am looking forward to see your cookie icon. In addition I like that you want to ask the user if he realy wants to delete his recipe. With that you confirm that the user didn`t delete it by mistake.

I am looking forward to hear more from your project.
When you read until hear, I wish you a nice day.

Sincerely COT-Team,
manually written 🙂

Hello COT-Team,

thank you for your feedback!

We already applied your suggestion regarding the scenario Edit Password. We are currently not planning to develop email verification at first. We would rather focus our time on core features and then implement non-core features.

'Duration' is an optional information. In this case we implemented in our "Create recipe" scenario only the

required fields.

Have a nice day 🙂

In sincerity,
your MyCookieBook-Team 🍪
